

Z83 SmartApply

Project README

Project Description

Z83 SmartApply is a web-based South African government job application assistant. It helps applicants create and manage their Z83 application by saving their profile information once, analysing pasted vacancy adverts, generating a tailored ATS-friendly CV, and loading the relevant vacancy and applicant details into an editable Z83 form.

The project is designed to make government job applications easier, faster and less error-prone while helping applicants prepare the information they need before submitting an application.

The Problem It Solves

Applicants often struggle to complete the detailed Z83 form, identify the important requirements in long government vacancy adverts, and adapt their CV for each position. This can lead to missing information, application errors and CVs that do not clearly match the advertised role.

Main Features

Feature	Description
Applicant profile	Saves personal details, qualifications, experience, languages and references once.
Job-advert analysis	Extracts the position, department, centre, reference number and requirements from pasted adverts.
Automatic Z83 filling	Loads relevant applicant and vacancy details into the editable two-page Z83 form.
Tailored ATS-friendly CV	Uses the vacancy requirements and applicant profile to create a role-aligned CV draft.
Local data saving	Keeps profile and application information available in the browser using localStorage.
Print and PDF support	Allows the completed Z83 application to be printed or saved as a PDF.

How It Works

1. The applicant creates an account or signs in.
2. The applicant completes their profile once.
3. The applicant pastes a government vacancy advert.
4. Z83 SmartApply analyses the advert and identifies important vacancy details.

5. The applicant clicks Load on Z83.
6. The system creates a tailored CV draft and loads the saved details into the Z83 form.
7. The applicant reviews missing fields, then prints or saves the application as a PDF.

Technologies Used

HTML5, CSS3, JavaScript, browser localStorage and responsive web design.

CV-Ready Description

Designed and developed Z83 SmartApply, a web-based South African government job application assistant using HTML, CSS and JavaScript. Built a profile workflow that stores applicant information, analyses pasted vacancy adverts, generates a tailored ATS-friendly CV aligned with job requirements, and automatically populates an editable two-page Z83 application. Implemented responsive styling, browser-based data persistence, form workflows and print-to-PDF support.

Short CV Version

Developed Z83 SmartApply, a front-end web application that analyses pasted government vacancy adverts, generates tailored ATS-friendly CVs and automatically populates an editable South African Z83 application using HTML, CSS and JavaScript.

Project Status

This project is currently a front-end prototype. Profile and application information is stored locally in the browser. A production version would add secure authentication, a database, encrypted document storage, server-side advert analysis and downloadable application packages.

Disclaimer: Z83 SmartApply is an independent application assistant and is not affiliated with or endorsed by the South African Government or the Department of Public Service and Administration.
